# Awesome frontend libraries and tools Google Fonts
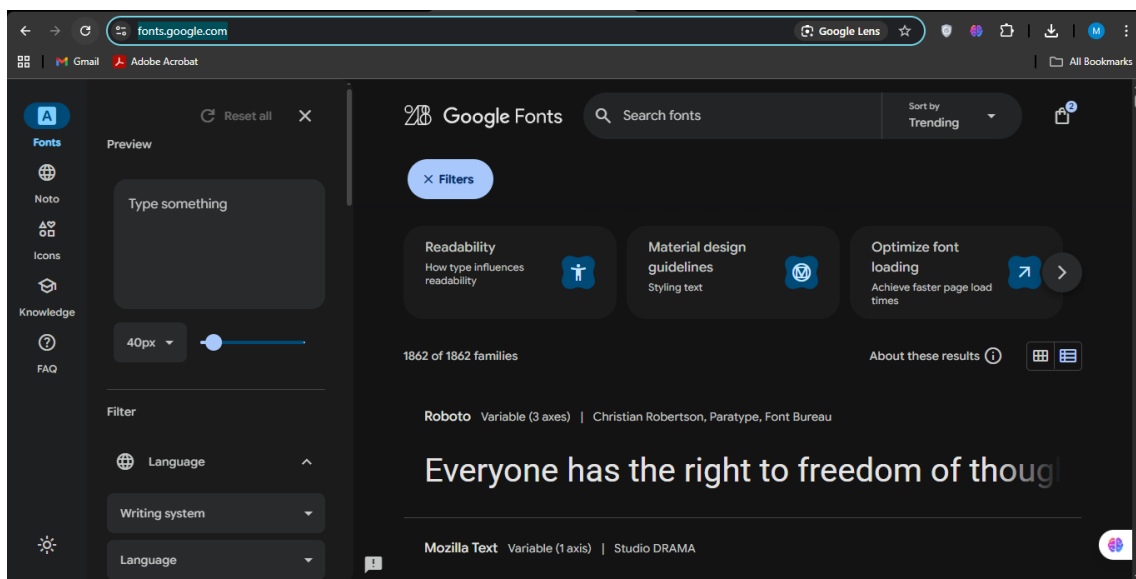

**Mehrshad Hekmatara**

بسم الله الرحمن الرحیم

## Introduction

**Google Fonts** is a free and open-source library of over 1,500 font families that can be easily integrated into websites and applications.
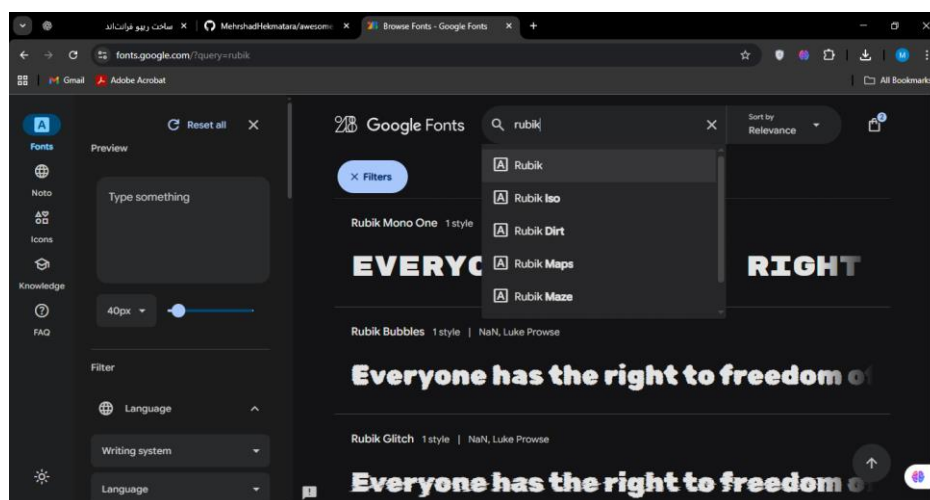

It offers a wide variety of typefaces, including serif, sans-serif, display, handwriting, and monospace fonts, making it a go-to resource for designers and developers.
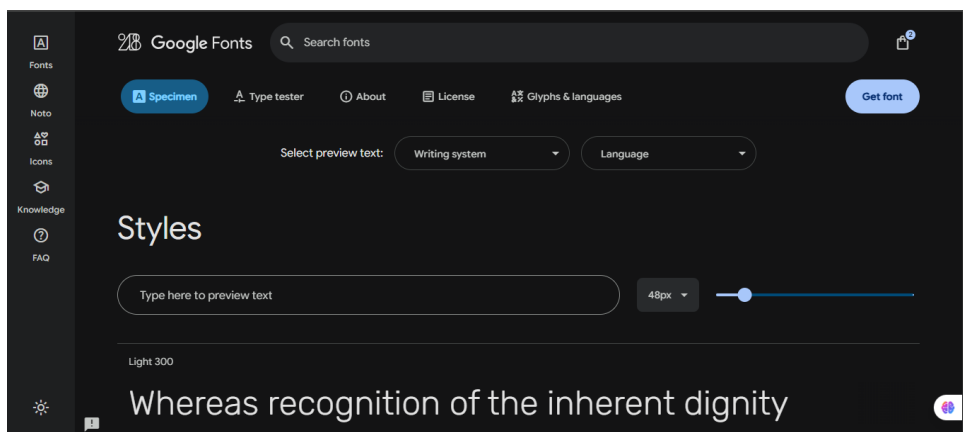

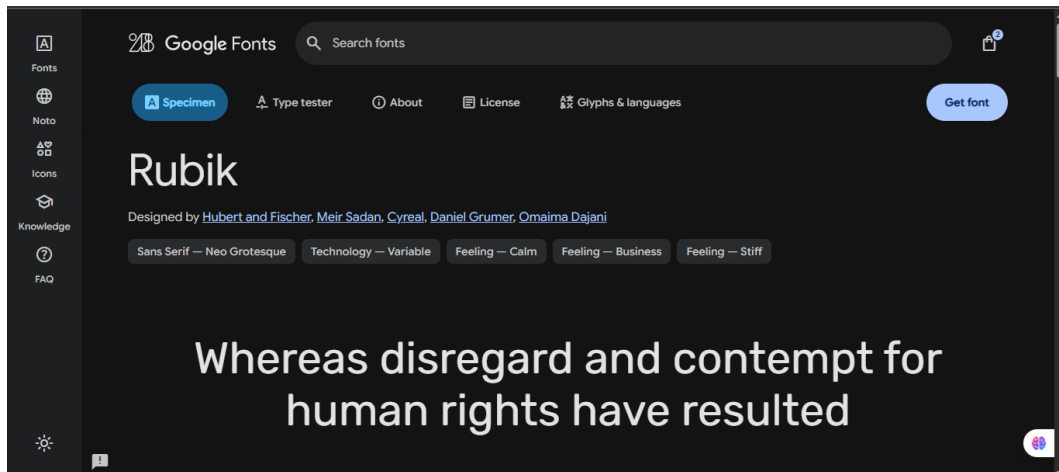

**/https://fonts.google.com**

## How to import a font family into our coding environment?

1 – go to google fonts website

2 – search for a font family

We  have different parts for this font in google fonts:
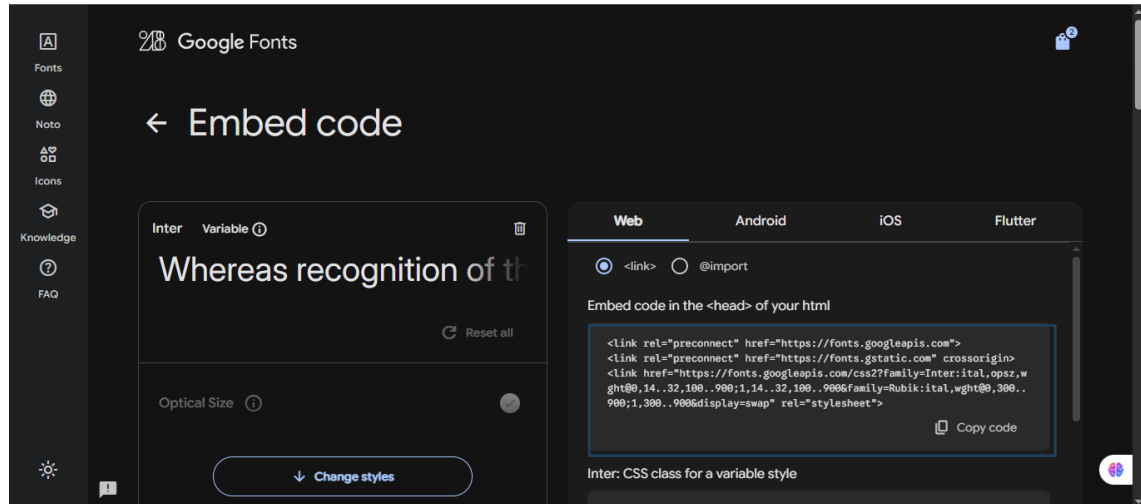

General information and presentation of font :

We can change language , font size and … and see how that effect our text.

We have something similar in this part of the website.

3 – click on get font → get embed code

Copy this code and then go to your code.

Copy them before your own css file.

4 – another method : click on get font → download all

And then import font manually into your code.

See the example for more information.
